## **ACKNOWLEDGEMENT**

The authors would like to express the appreciation and deep gratitude to the team who was the pioneer to accomplish the injury surveillance system, trauma registry task force committee. Dr. Witaya Chadbunchachai, WHO expert advisory panel for injury prevention and control and the one who adopted this injury surveillance system and also distributed to whole Thailand, Dr. Chamaiparn Santikarn.

The author would like to give a special thanks to Dr. Kriangsak Watcharanukulkiat, the director of Khon Kaen Hospital for his vision and mission to support the Trauma and Critical Care Center, and a big thanks to all of the Emergency Department team, Mrs. Thanyaras Piyawatchwela the head nurse of Emergency Department and also the injury surveillance clerks for their completing the database during the process.

Lastly, the authors would like to dedicate this report to their loving parents for their great supports and encouragements.

Executive summary table of trauma registry 1997-2022.....	1
I. Introduction.....	3
II. Objectives.....	3
III. Methodology.....	3
IV. Results.....	5
1. Demographic data.....	5
1.1 Injuries and fatalities by gender.....	5
1.2 Injuries and fatalities by age.....	7
1.3 Injury by occupations.....	11
1.4 Cause of injury.....	13
1.4.1 Deaths by causes.....	14
1.4.2 Injury by various causes.....	17
1.4.3 Fatality by various causes.....	22
2. Traffic injury.....	26
2.1 Seasonal distribution of traffic injury .....	27
2.2 Type of vehicle.....	28
2.3 Age group distribution.....	31
2.4 Traffic injury by time of crashes.....	32
2.5 Risk behaviors.....	33
2.5.1 Helmet used.....	34
2.5.2 Alcohol used.....	35
2.5.3 Alcohol used by vehicle type.....	38
2.5.4 Seatbelt used.....	44
2.5.5 Helmet used and alcohol used.....	46
3. Non traffic injury.....	50
3.1 Non traffic injury by month.....	50
3.2 Specific type of non traffic injuries.....	51
3.2.1 Burn.....	51
3.2.2 Animate injury.....	52
3.2.3 Inanimate injury.....	53
3.2.4 Falling.....	56
3.2.5 Self harm and assault.....	59
4. Hospital information.....	69
4.1 Admission rate by referral system.....	70
4.2 Mortality rate by referred and non referred.....	71
4.3 Fatality rate and survival rate by traffic and non traffic cause.....	72
4.3.1 Traffic injury.....	72
4.3.2 Non traffic injury.....	73
4.4 Quality of care.....	75
4.4.1 Critical procedure performed by EMT and volunteers.....	76
4.4.2 Critical procedure performed during the referral.....	77
4.5 Severity of injury.....	78
4.6 GIS based for monitoring the injury prevention program in Khon Kaen Municipality.....	81

## ***I. Introduction***

After the Injury Surveillance system (IS) was first implemented and collected in Khon Kaen Hospital (KKH) since 1989, IS data has been reporting in terms of Trauma Registry (TR) annually since then. The IS national software program was started to use since 1997. The annual snapshot of data collected is very important especially for those who are working in these violence and injury area. As far as Khon Kaen team concerns, having continuous data collection and demonstrating them in a continuously manner should be very useful for those who are dealing with this topic.

---

## ***II. Objectives***

The objectives of 26 years Anniversary of Trauma Registry is:

1. To demonstrate the trends of injuries in Khon Kaen Province based on Khon Kaen Hospital Injury Surveillance (IS) database from 1997 to 2022.
  2. To establish the information set for supporting the monitoring system of the Continuous Quality Improvement program in trauma care system.
  3. To establish the information set for decision makers on the injury prevention and control program.
  4. To establish the tool for studying the factors contributing for mortality and morbidity for improving the quality of care.
- 

## ***III. Methodology***

1. TR reports, from 1997 to 2022, were collected and analyzed from Khon Kaen Hospital
  2. IS database, Khon Kaen Hospital.
  3. Descriptive method was used to illustrate the results
-

## 26 years Trauma registry

It is a great pleasure to welcome you to the 26 years significant report from the Khon Kaen Hospital Trauma Registry since 1997. Trauma and injuries have claimed many lives, injured many people. The number of injuries in term of deaths, hospitalizations, disabilities and socioeconomic loss are increasing steadily. The public health approach in identifying the scope, magnitude and priority accorded to injury problems is to obtain appropriate information. An injury surveillance (IS) system which is the ongoing and systematic collection analysis and dissemination of injury information to those concerned with prevention is an important tool. The system is a very effective tool for policy-maker to make appropriate decisions in planning and monitoring injury prevention and control activities.

### ***Data flow and processing***

Data are being collected by the IS clerk using the injury surveillance form except final diagnosis. Medical statisticians and medical record personnel in the hospital code and enter the set of data. Quality assurance is done by the emergency room nurse and medical record personnel. The IS nurse in trauma center analyses data and prints out all the tables in the menu of the injury surveillance program. The report is disseminated at provincial as well as national levels for advocacy purposes.

### ***Key area of work of injury surveillance system:***

- Create health awareness among the population including trauma care center.
- Health service delivery
- Quality improvement.
- Behavior change.
- Human Resource Development.
- EMS system development.
- Institutional Development

### ***Data utilization at the hospital level***

Data generated from the injury surveillance system are being used to evaluate the quality of care by using the outcome of treatment related to the severity of injury, since the high probability of survival (Ps) then it should be less the number of deaths. Therefore the Ps was apply to be the indicator to detect the quality of care especially the preventable death which should have high incidence of survival but death. Moreover by seeking do and undo the critical procedure was also applied to evaluate the quality of care in EMS and referral system.

### ***Data utilization at the community level***

The injury surveillance (IS) database can be used to facilitate injury prevention in any point of view. The data utilization which was applied such as the leaflet about the dog bite how big impact to the community, the trend of traffic accident in Khon Kaen Municipality and the suggestion for traffic injury prevention etc.

**IV. Result**

**Figure 1 Number of injuries and deaths by gender (1997-2022)**

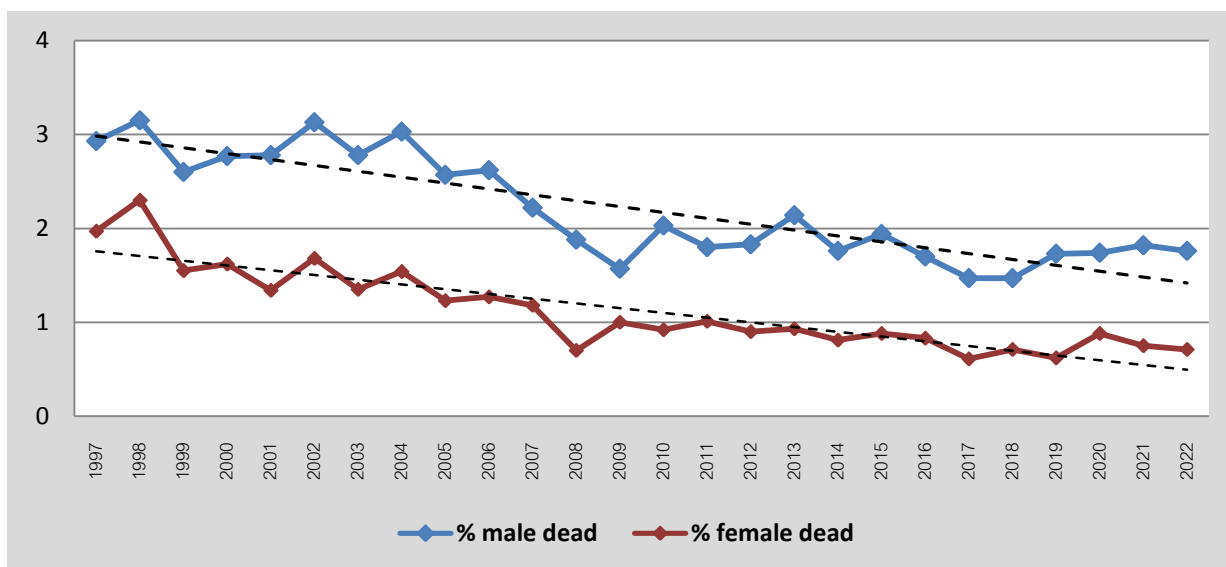

Injuries and deaths both in male and female were increasing from 1997 to 2010, since then the number of injury and deaths were quite similar in each year. but since 2019 were decreasing

**Figure 2 Proportion of injury by gender (1997-2022)**

It was show that the proportion of injuries in male more than female.

**Figure 3 Mortality rate by gender (1997-2022)**

The proportion of fatalities in male was two times more than female. The trends of mortality rate were decreasing in both genders

## 1.2 Injuries and fatalities by age

It was shown that the age group between 15-30 were the most vulnerable with 30-46% of all injuries but tended to be reduced. The victims whose age 15-30 years old was indicated the most vulnerable group by the fatality rate in 1997 to 2013 but in 2014 age 30- 45 years old were the most and tended to be decreased.

**Figure 4 Percentage of injury by age group (1997-2022)**

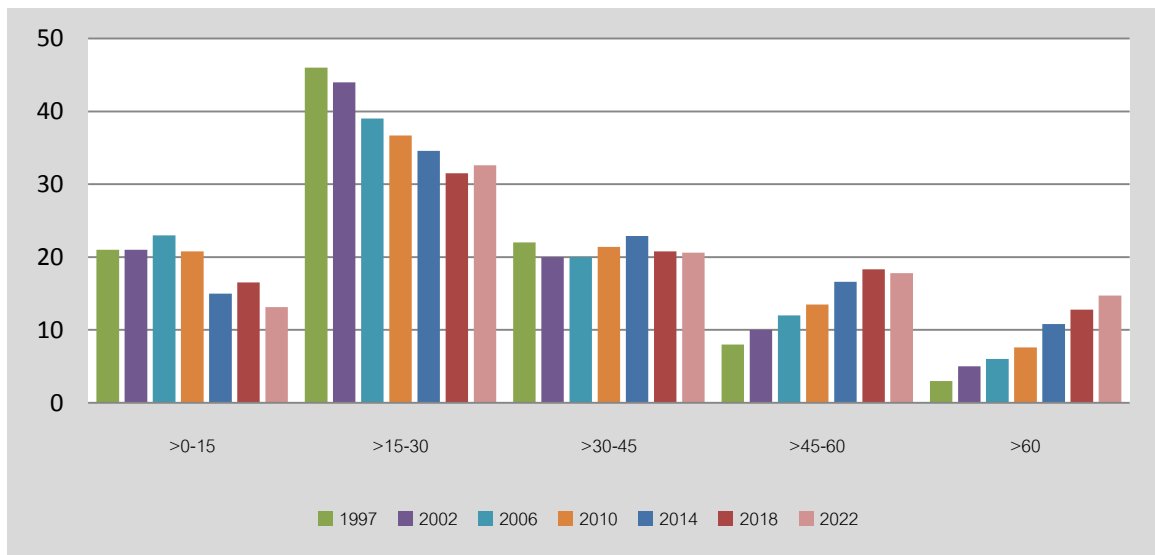

**Figure 5 Percentage of fatality by age group (1997-2022)**

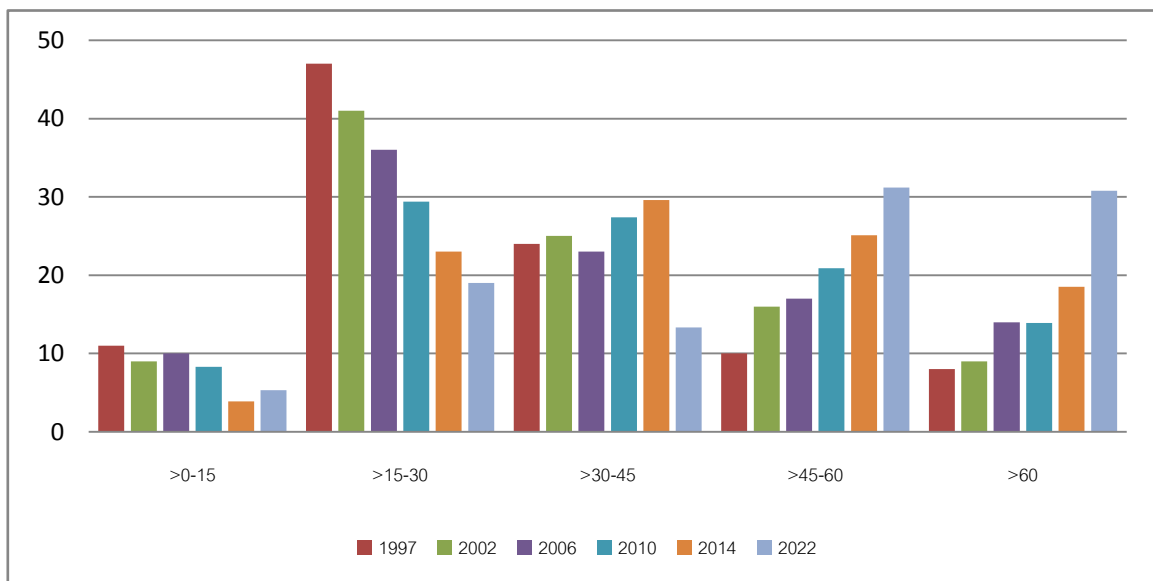

**Figure 6 Injuries by age group distribution every 5 years**

The injuries at age >15-30 years old were the largest group with tended to be decreased. Then concern the age group more than 45 years old, the injury rate were tended to be increased.

**Figure 7 Deaths by age distribution every 5 years**

The age group between 15-30 years old were the most vulnerable group but tended to be decreased.

### 1.3 Injury by occupations

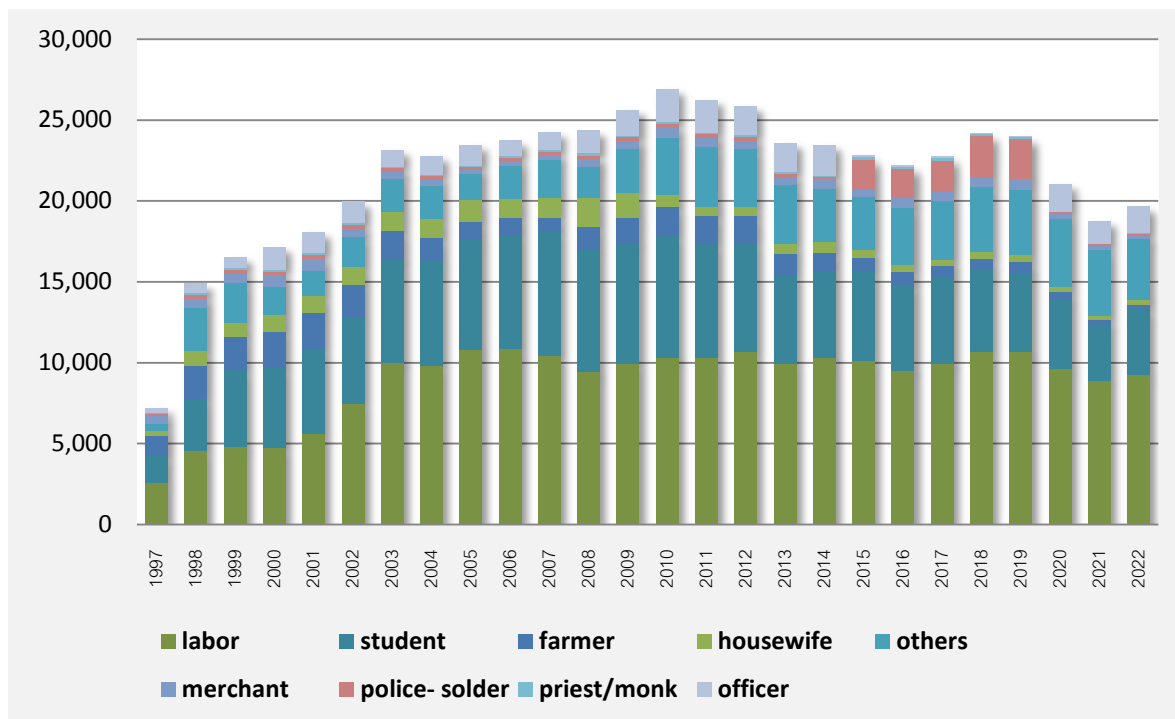

**Table 4 Number of injury by occupation (1997-2022)**

**Figure 8 Number of injury by occupation (1997-2022)**

It was shown that the labors group was the most vulnerable, followed by the student.

**Figure 9 Percentage of injury by occupation (1997-2022)**

It was shown that the labors group was the most vulnerable, followed by the student.

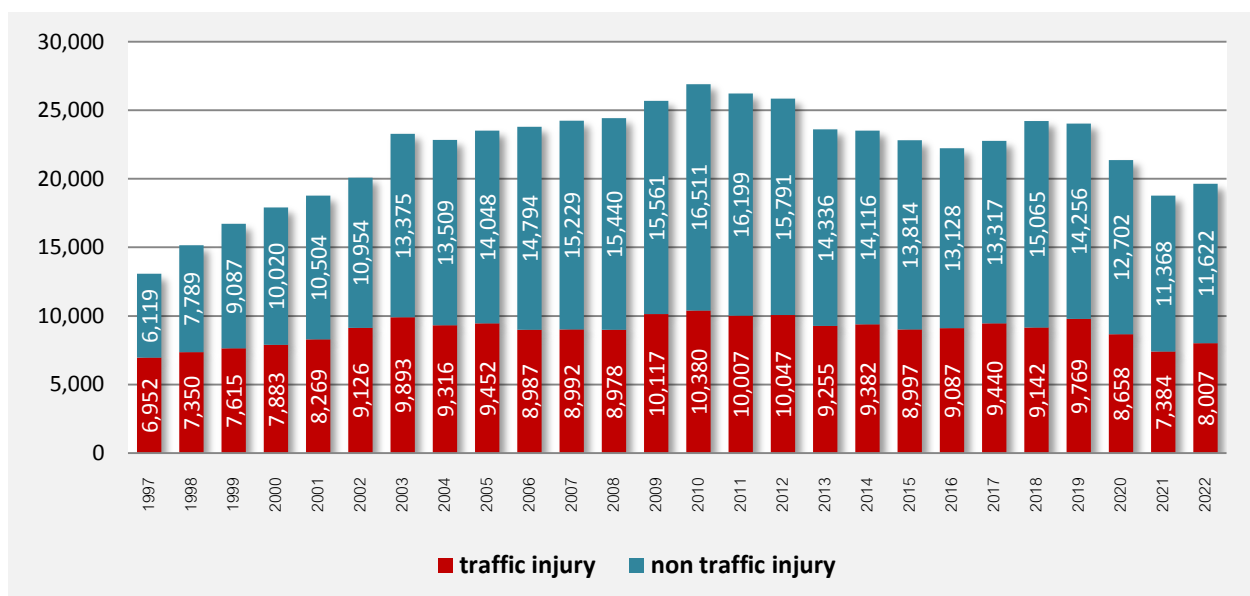

### 1.4 Cause of Injury

**Table 6 Number of injuries by causes (1997-2022)**

year	traffic injury	% TI	non traffic injury	% non TI	total injury
1997	6,952	53.19	6,119	46.81	13,071
1998	7,350	48.55	7,789	51.45	15,139
1999	7,615	45.59	9,087	54.41	16,702
2000	7,883	44.03	10,020	55.97	17,903
2001	8,269	44.05	10,504	55.95	18,773
2002	9,126	45.45	10,954	54.55	20,080
2003	9,893	45.52	13,375	57.48	23,268
2004	9,316	40.81	13,509	59.19	22,825
2005	9,452	40.22	14,048	59.78	23,500
2006	8,987	37.79	14,794	62.21	23,781
2007	8,992	37.12	15,229	62.88	24,221
2008	8,978	36.77	15,440	63.23	24,418
2009	10,117	39.4	15,561	60.6	25,678
2010	10,380	38.6	16,511	61.4	26,891
2011	10,007	38.19	16,199	61.81	26,206
2012	10,047	38.88	15,791	61.12	25,838
2013	9,255	39.23	14,336	60.77	23,591
2014	9,382	39.93	14,116	60.07	23,498
2015	8,997	39.44	13,814	60.56	22,811
2016	9,087	40.9	13,128	59.1	22,215
2017	9,440	41.48	13,317	58.52	22,757
2018	9,142	37.77	15,065	62.23	24,207
2019	9,769	40.66	14,256	59.34	24,025
2020	8,658	40.6	12,702	59.5	21,361
2021	7,384	39.37	11,368	60.62	18,754
2022	8,007	40.79	11,622	59.21	19,628

The number of non-traffic injuries in 1997- 2018 were increasing and more than traffic injury since 1998. but since 2019 tended to be decreased.

**Figure 10 Number of injury by cause (1997-2022)**

The number of non-traffic injuries more than traffic injury since 1998.

### 1.4.1. Deaths by causes

**Table 7 Number of deaths by causes (1997-2022)**

When concerning the type of death, there were classified into 3 places consisted of 1: Dead Before Arrival (DBA), 2: Death at Emergency Room and 3: Death at ward. Even though the number of death of traffic cause was higher than non traffic cause.

**Table 8 Percentage of death by causes (1997-2022)**

Year	Traffic cause			Non traffic cause		
	%DBA	% at ER	%at ward	%DBA	%at ER	%at ward
1997	8.97	11.96	79.07	20	8.89	71.11

2019	0	21.33	78.67	0	17.14	82.86
2020	1	26.7	72.4	1	13.4	85.8
2021	0	25	75	0	10	90
2022	0	20.24	79.76	2.13	18	79.79

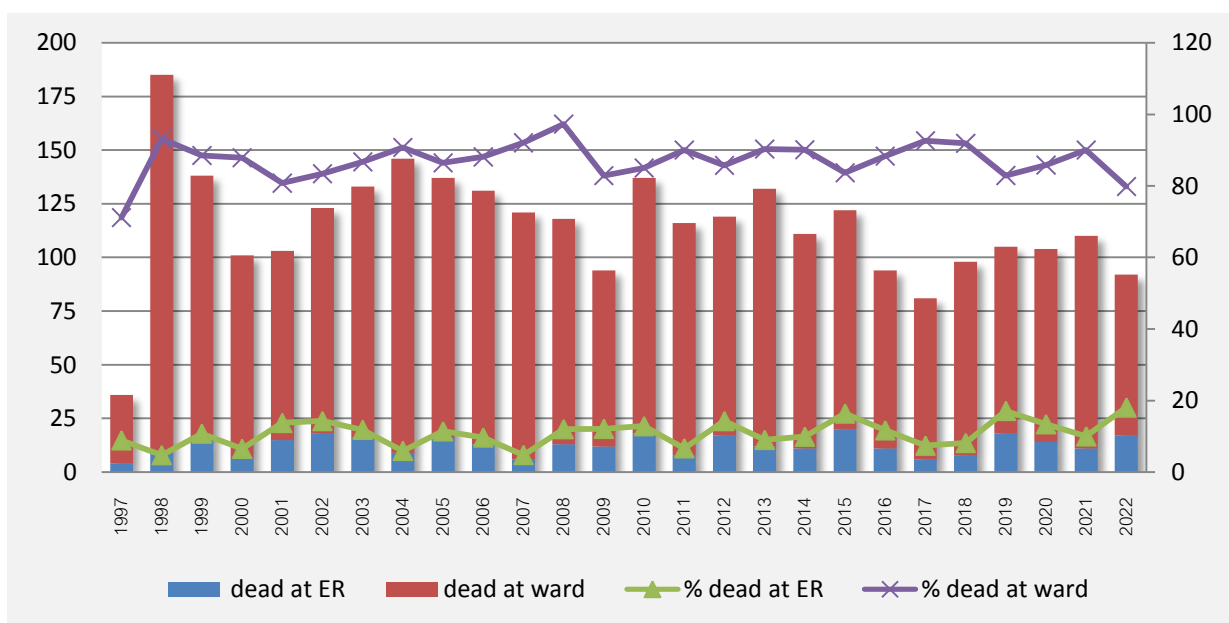

In both causes of death, the death at ward was among the place of death (72-88% by traffic cause and 71-97 % by non traffic cause)

**Figure 11 Number and Percentage of deaths by traffic cause (1997-2022)**

The percentage of traffic fatality at ward was highest (88.54%) and tended to be decreased since 2007. but 2020 was increasing.

**Figure 12 Number and percentage of deaths by non traffic cause (1997-2022)**

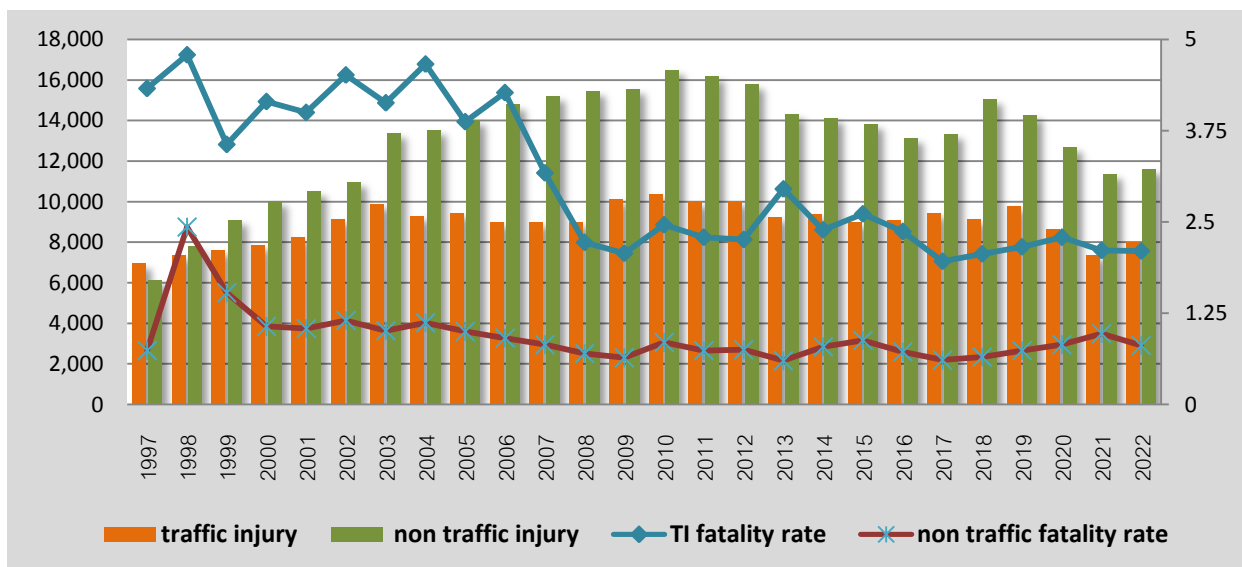

In non-traffic injury group, the percentage of the deaths at ward was highest (70-97%) when comparing with the death at ER and DBA.

**Table 9 Number and fatality rate by causes (1997-2022)**

Years	traffic			non traffic		
	injury	death	TI fatality rate	injury	death	fatality rate
1997	6,952	301	4.33	6,119	45	0.74
1998	7,350	352	4.79	7,789	189	2.43

**Figure 14 Percentage of injury by various causes (1997-2022)**

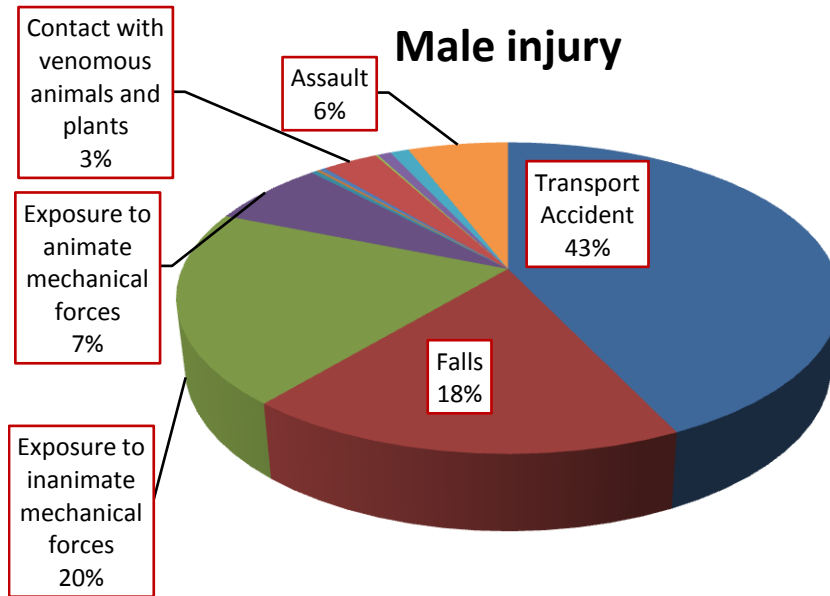

It was shown that the percentage of traffic injury was highest (>40%), fall was the second ; inanimate injury was the third, animate injury was the fourth, and injury by assault was the fifth.

Although the number of the traffic injury was increasing but if analyzed by proportion, it was found that traffic injury was relatively decreasing. Right wise, the injury by fall, inanimate injury, animate injury and assault seemed to be increasing.

**Figure 19 Seasonal distribution of traffic injury (2010-2022)**

The number of traffic injured patients was increasing during December – January (New Year Festival), but in 2020-2022 was decreasing during April (Thai New Year Festival- Songkran Festival) due to Covid-19 Pandemic.

## 2.2 Type of vehicle

Traffic injury was the most common cause of all injury. Among road traffic injury, 85.03% was motorcycle injury. The Pick up injuries was the second (4.13%), followed by bicycle or tricycle injury (3.11%). The pedestrians had higher risk to get injury (2.5%)

**Figure 20 Number of traffic injury by vehicles (1997-2022)**

Motorcycle was the most vulnerable when comparing with the other road users.

**Figure 21 traffic injuries by vehicle type in 2022**

By comparison the vehicle caused traffic injuries; it was show the motorcycle accident was the most common cause of injuries (85.03%) the second was the pick up accident (4.13%)

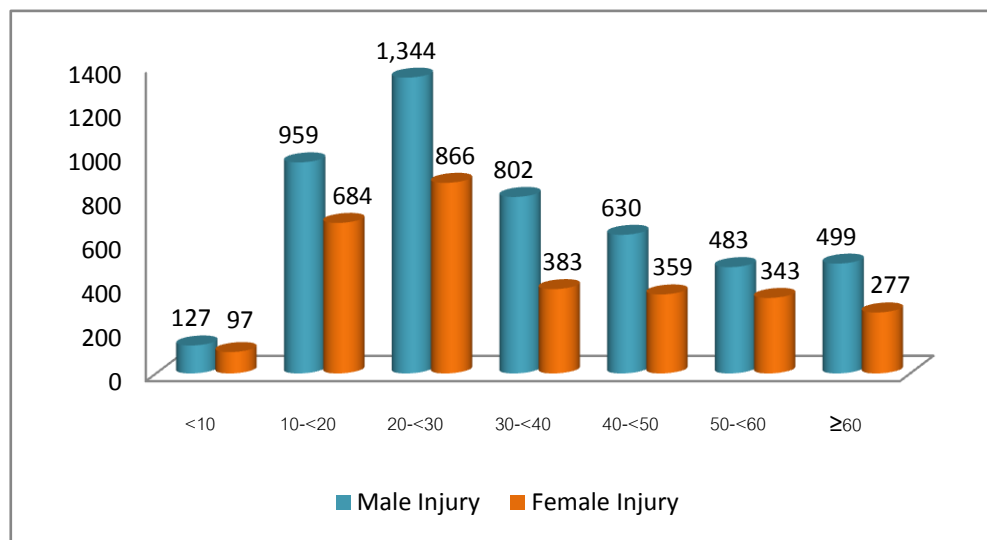

### 2.3 Age group distribution

**Figure 24 Number of traffic injury by time distribution (1997-2022)**

It was found that the peak time of the traffic injuries were 06.00-8.00 p.m. and slightly decrease after that.

**2022**

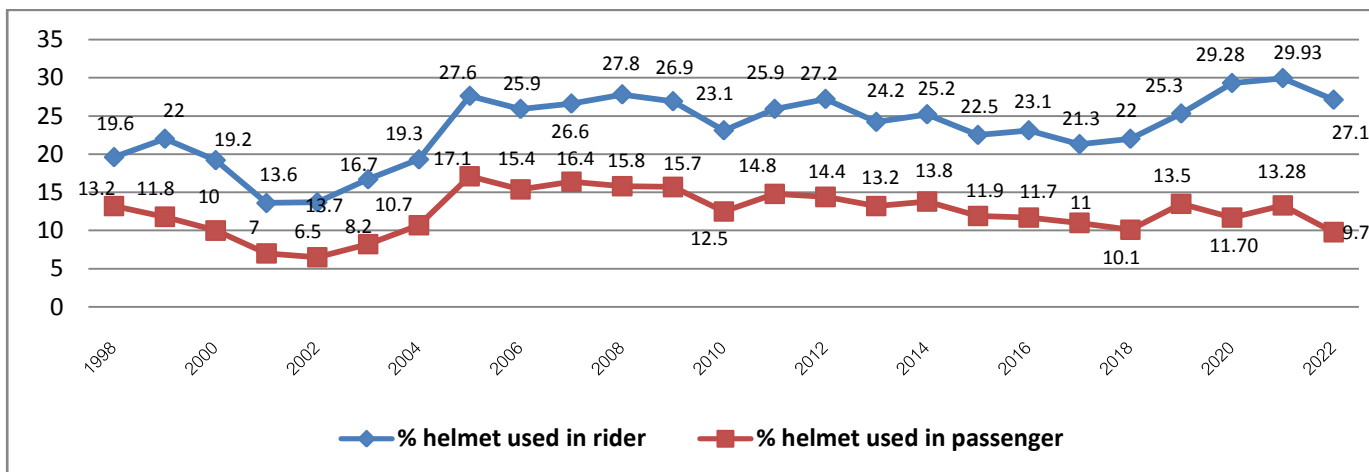

## 2.5 Risk behaviors

### 2.5.1 Helmet used

**Figure 25 Percentage of helmet used injury (1997- 2022)**

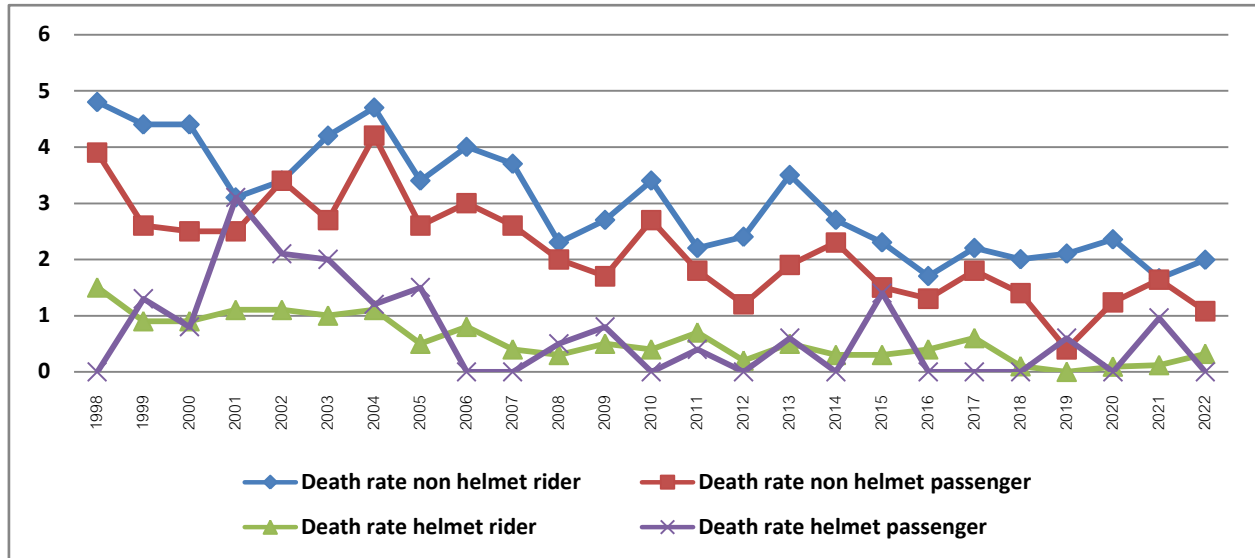

The proportion of helmet used in motorcycle driver injured in transport accident was higher than passenger. It was shown that the trend of helmet used was slightly decreased since 2005, but in 2018 trended to be increasing.

Alcohol used was an important indicator to indicate the vulnerability of drink drive and the impact of drink drive campaign.

**Figure 27 Percentage of injury with alcohol used (1997-2022)**

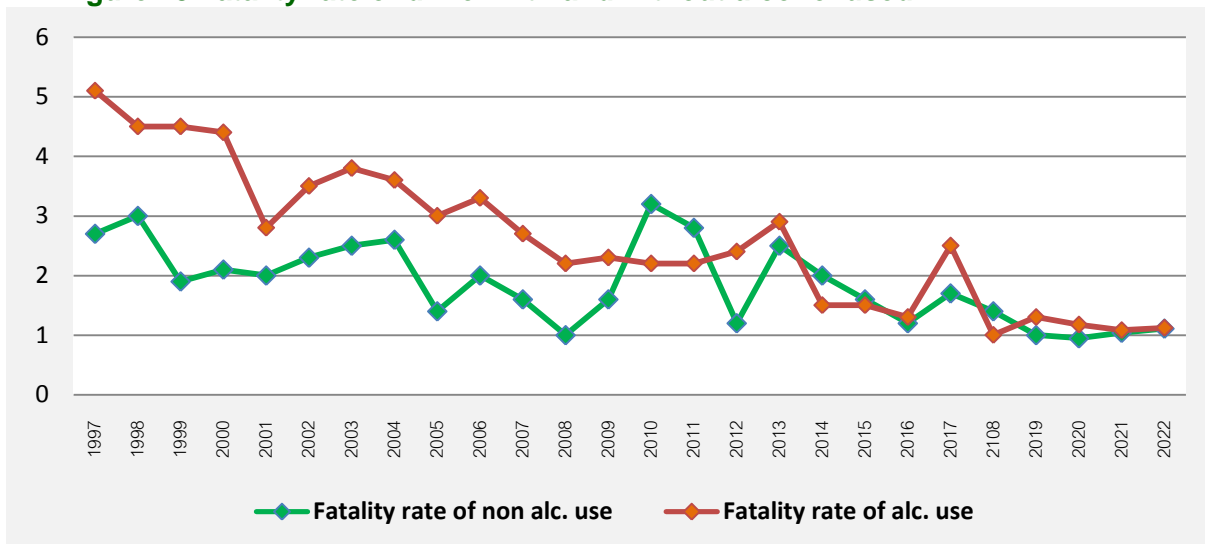

The trend of alcohol used among driver was slightly decreasing but the passenger and pedestrian seemed to be increasing.

**Table 24 Number of death, with and without alcohol used (1997-2022)**

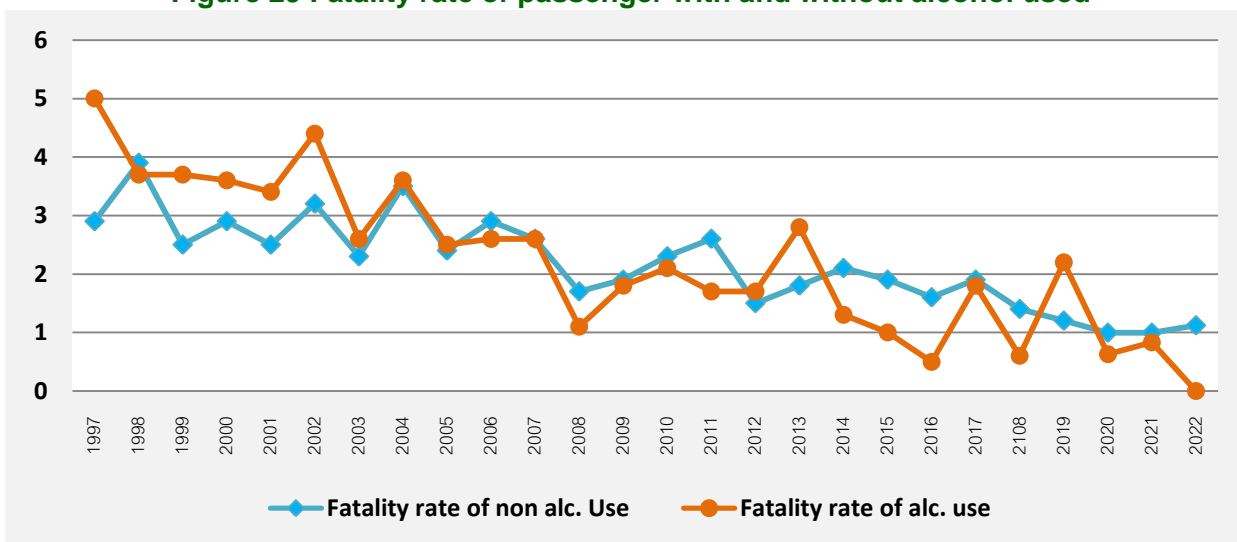

Year	Pedestrian death				Driver death				Passenger death

The mortality rate of Pedestrian with alcohol used was highest. Mortality rate of Passenger with alcohol used was lowest and also seemed to be decreasing. Mortality rate of passenger without alcohol used was the second and also tended to be decreasing while the mortality rate of the driver with the alcohol used did not have a significant changed.

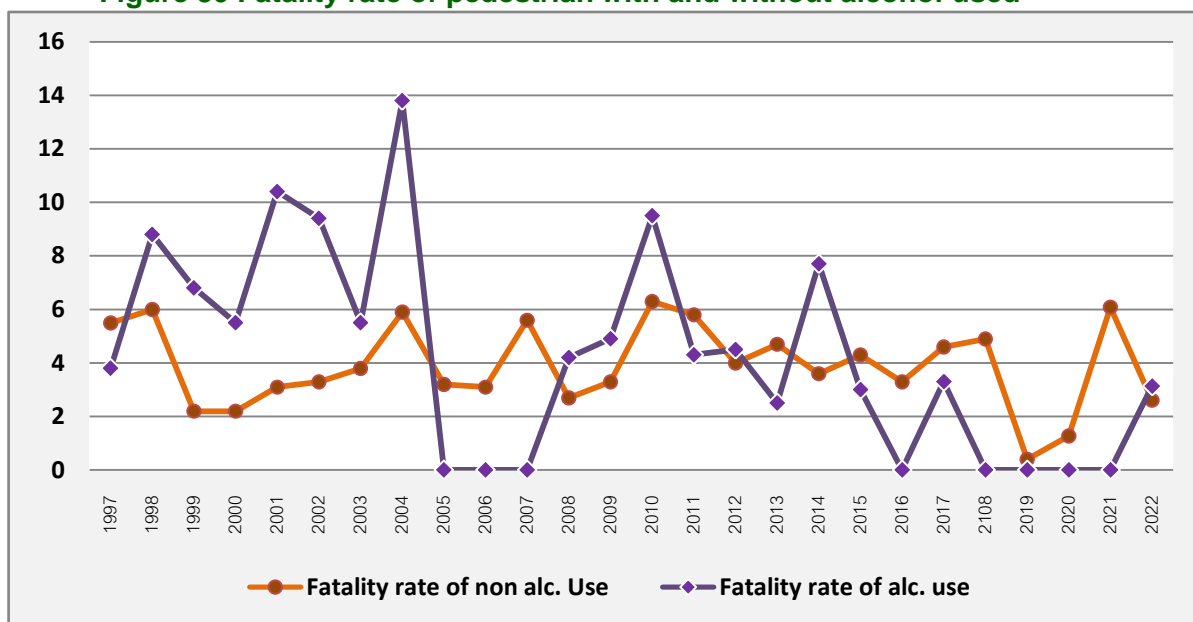

**Figure 28 Fatality rate of driver with and without alcohol used**

**Figure 29 Fatality rate of passenger with and without alcohol used**

**Figure 30 Fatality rate of pedestrian with and without alcohol used**

**Figure 31 Percentage of injury by vehicle type with alcohol used (1997-2022)**

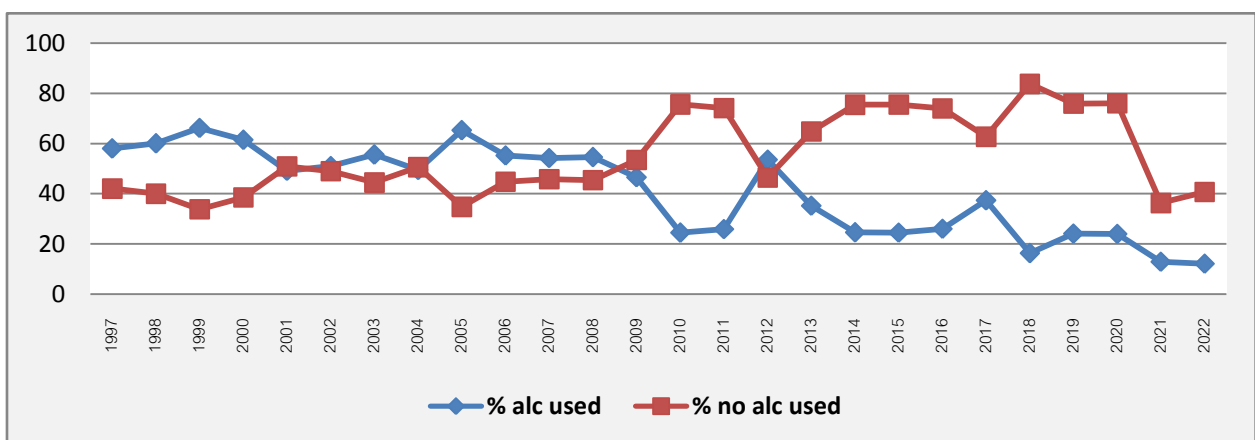

The alcohol used in injured patients in motorcycle, sedan and pick up users were highest among all vehicle user but the trend did not have significant changed.

**Figure 32 Proportion of motorcyclist injury with & without alcohol used (1997-2022)**

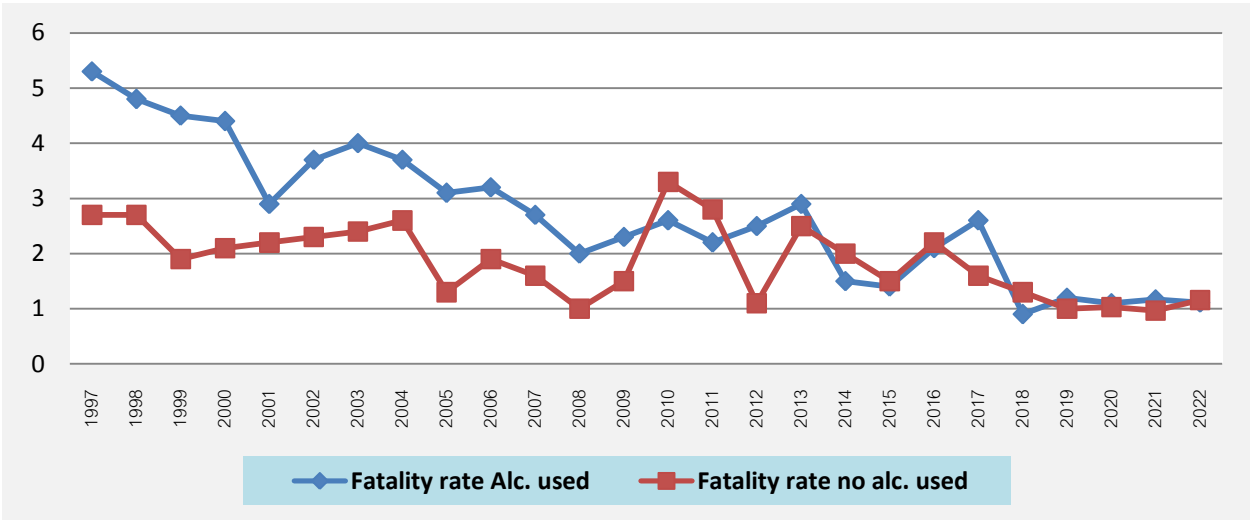

**Figure 33 Proportion of motorcyclist death with & without alcohol used (1997-2022)**

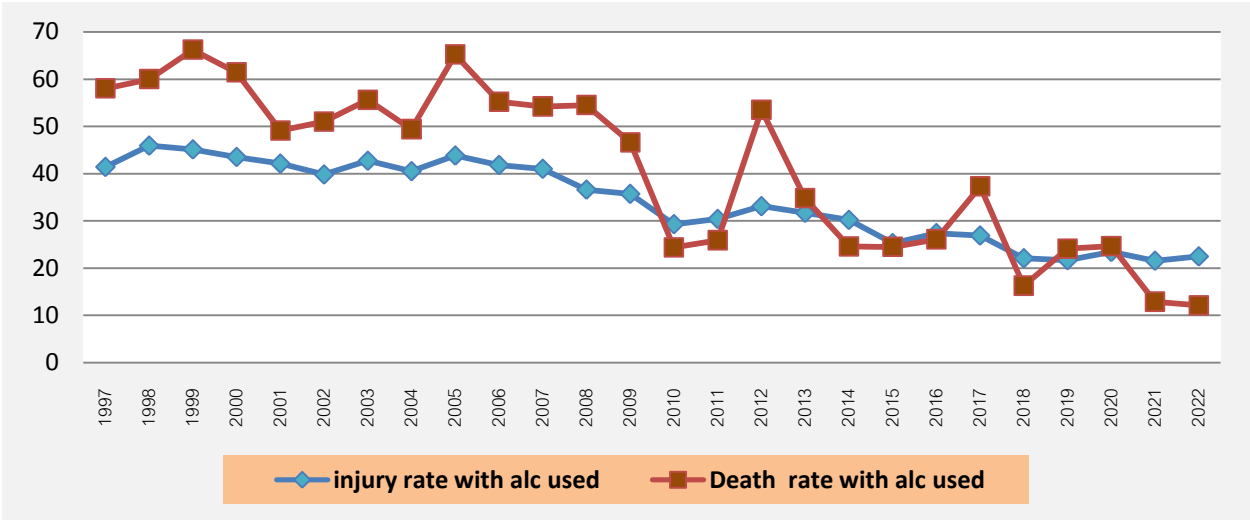

Due to number of death among vehicle users apart from motorcycle was small and the rate was fluctuated, we would not analyze the mortality of other vehicle user.

**Figure 34 Fatality rate of motorcyclist with & without alcohol used (1997-2022)**

Fatality rate of motorcyclist with alcohol used tended to be decreasing.

**Figure 35 Injury rate and death rate of motorcyclist with alcohol used (1997-2022)**

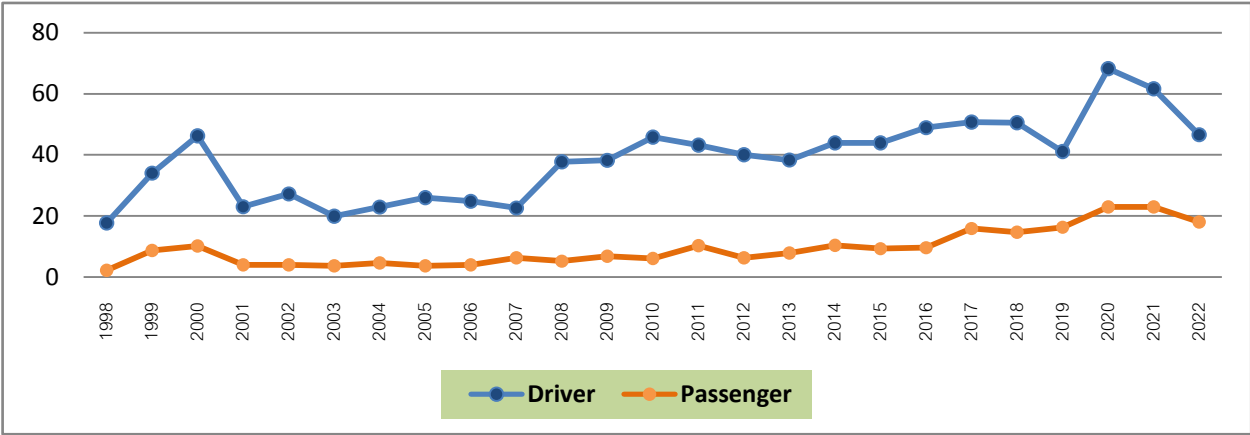

For motorcycle injury, the fatality rate of alcohol used tended to be decreasing in both group.

## 2.5.4 Seatbelt used

**Table 28 Injury and fatality with and without seatbelt used (1997-2022)**

Figure 43 Seasonal distributions of non-traffic injuries

It was shown that the number of non-traffic injury was increasing, highest during the vacation period (summer vacation during May), midterm vacation in October.

**Figure 43 Seasonal distributions of non-traffic injuries**

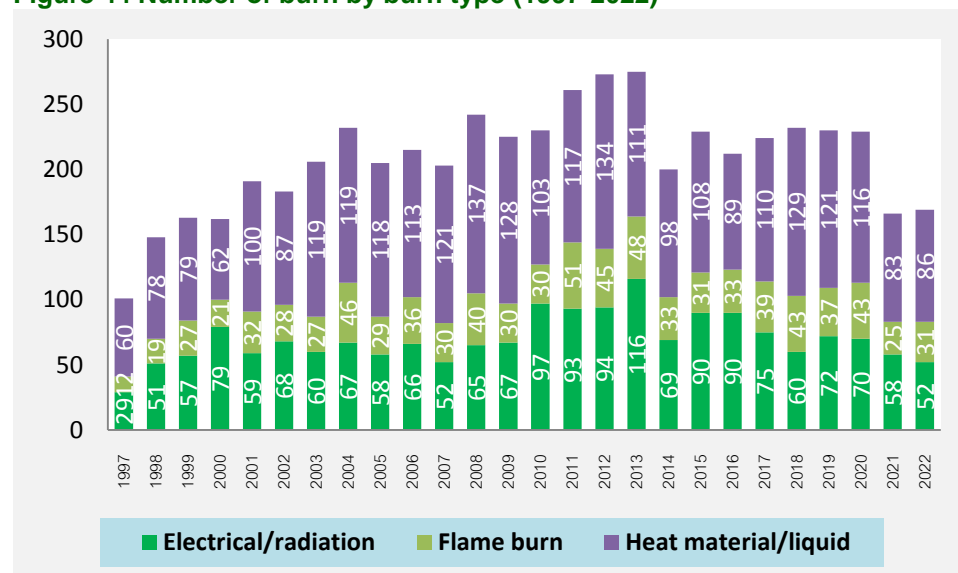

### 3.2 Specific type of non traffic injuries

#### 3.2.1 Burn

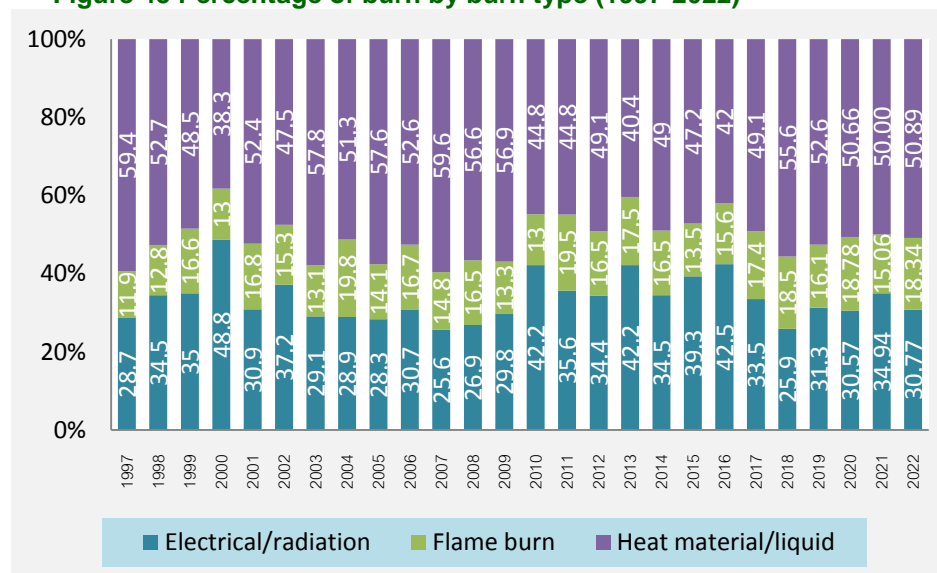

**Table 34 Burn injury classified by burn type (1997-2022)**

Burn	1997	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

**Figure 44 Number of burn by burn type (1997-2022)**

**Figure 45 Percentage of burn by burn type (1997-2022)**

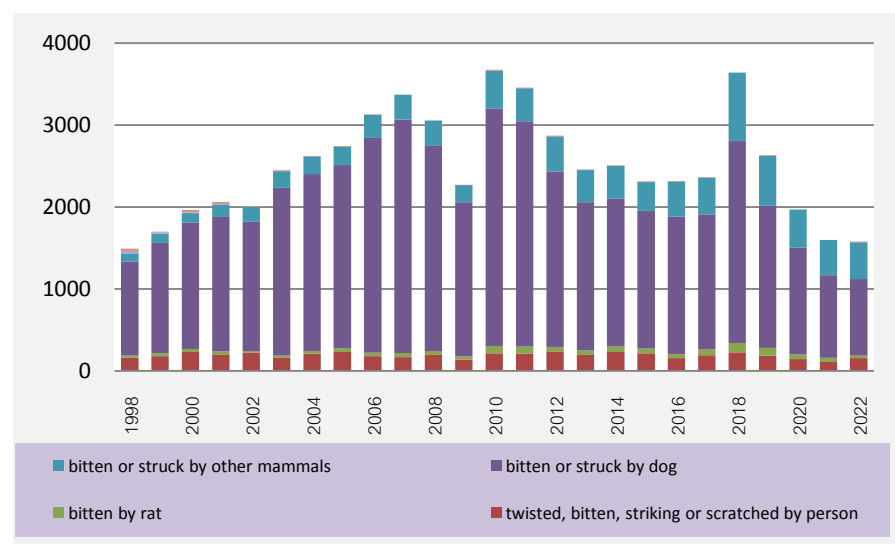

Burn was classified into 3 types based on ICD 10. It was indicated that the heat material or liquid was the most common cause of burn injury. The number of burn injury was decreasing but the cause of burn injury was proportionally the same except the electric/radiation which seemed to be slightly decreased

### 3.2.2 Animate injury

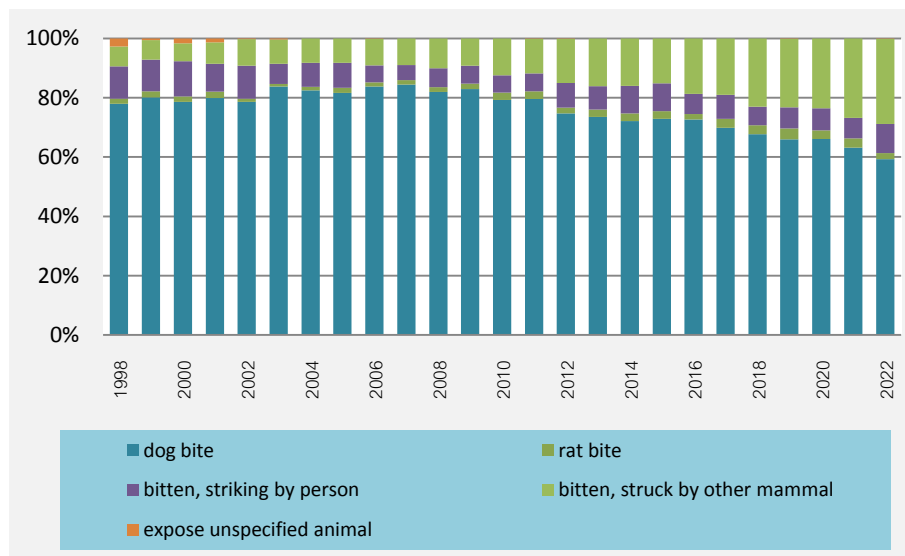

**Table 35 Causes of animate injury (1997-2022)**

cause of animate	1998	1999	2000	2001	2002	2003	2004	2005	2006	2007	2008	2009	2010	2011	2012	2013	2014	2015	2016	2017	2018	2019	2020	2021	2022

**Figure 50 Number of Inanimate injuries (1997-2022)**

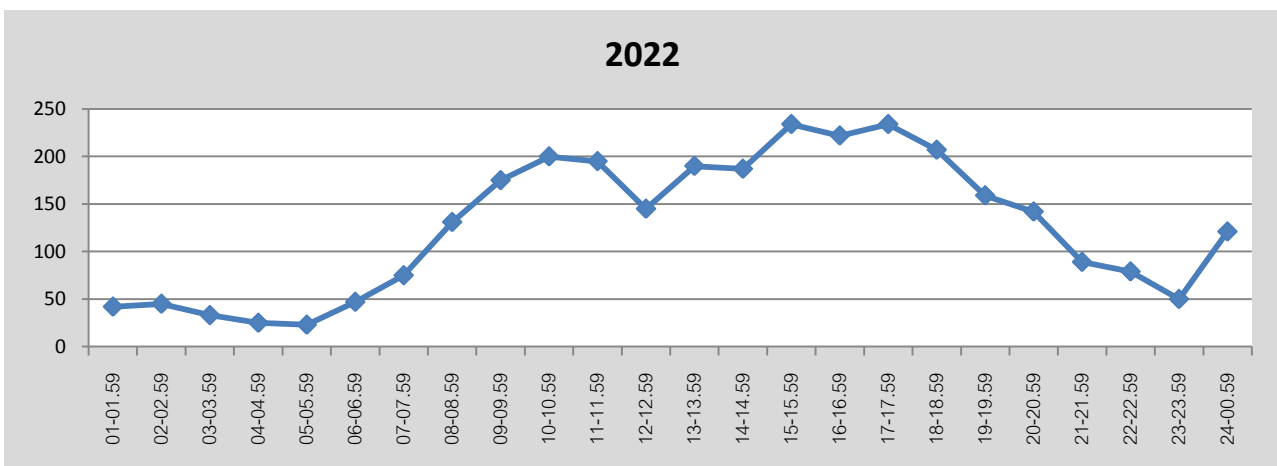

It was shown that inanimate injuries tended to be slightly increased 1997 to 2012 and then was decreased.

**Figure 51 Inanimate injuries by time distribution (1997-2022)**

It was shown that the highest incidence of inanimate injuries occurred during 04.00 p.m. to 06.00 p.m.

**Figure 52 Number of fall injury by age group (1997-2022)**

**Figure 53 Percentage of fall injury by age group (1997-2022)**

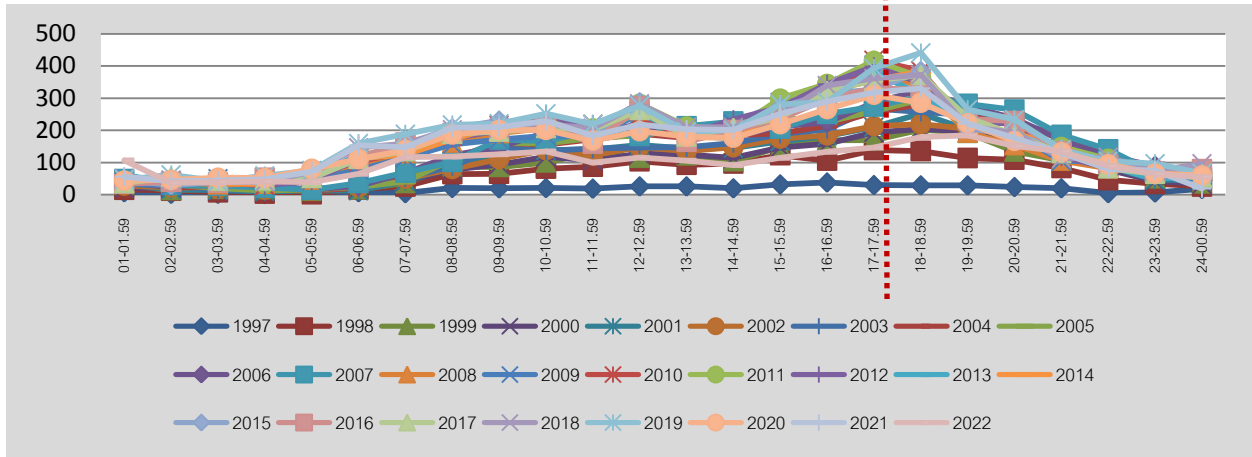

The percentage of fall injury below 9 years old group and 10-19 years old group tended to be decreased while 50 years old and over tended to be slightly increased.

**Table 39 Falls injury by time distribution (1997-2022)**

**Figure 54 Falls injury classified by time (1997-2022)**

Fall injury had highest incidence during 5.00-6.00 p.m.

**Figure 55 Falls injury classified by age group in 2022**

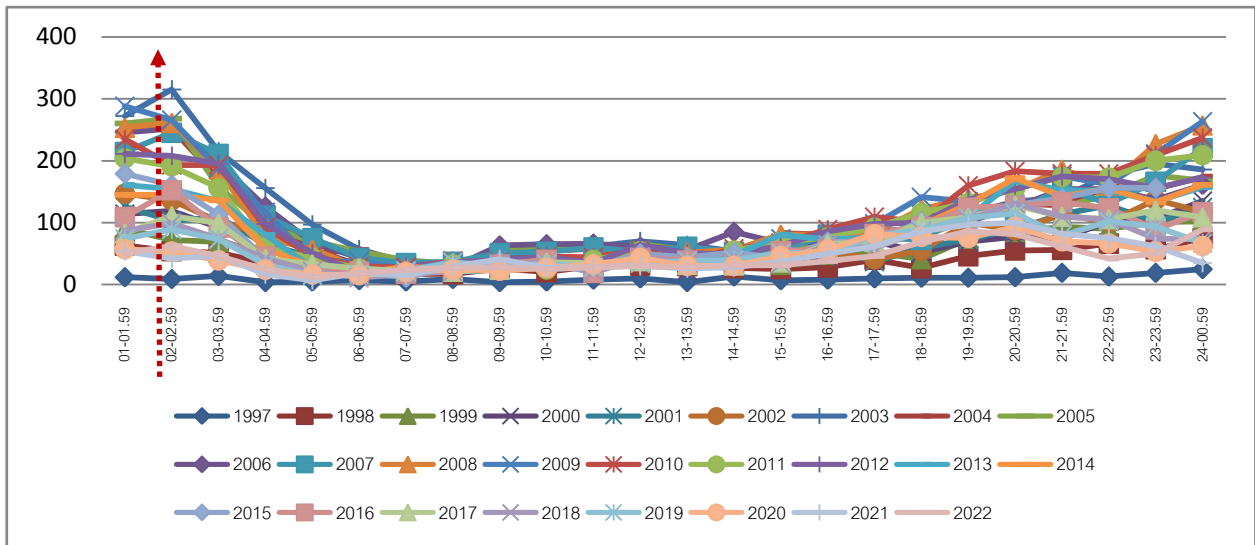

It was shown that age group 70 years old and over had highest of fall injuries.

3.2.5 Selfharm and assault

2011	26,206	8,374	31.95	7,740	29.54	5,550	71.71
2012	25,838	8,559	33.13	7,691	29.77	5,783	75.19
2013	23,581	8,043	34.11	7,273	30.84	5,476	75.29
2014	23,498	7,928	33.74	7,179	30.55	5,404	75.28
2015	22,811	8,091	35.47	6,915	30.31	5,435	78.6
2016	22,215	8,283	37.29	6,824	30.72	5,434	79.63
2017	22,757	8,646	37.99	6,675	29.33	5,348	80.12
2018	24,207	9,233	38.14	6,847	28.29	5,444	79.51
2019	24,025	10,576	44.02	7,294	30.36	6,055	83.01
2020	21,361	9,438	44.18	6,192	28.99	5,210	84.14
2021	18,752	8,752	46.67	5,593	29.83	4,806	85.93
2022	19,628	8,474	43.17	4,448	22.66	3,700	83.18

**Figure 67 Injury admission and admission rate**

The numbers of injuries were increasing and then 2019 tend to decreased. And the numbers of traumatic admission were also slightly decreasing.

**Figure 68 All injury refer and admission rate**

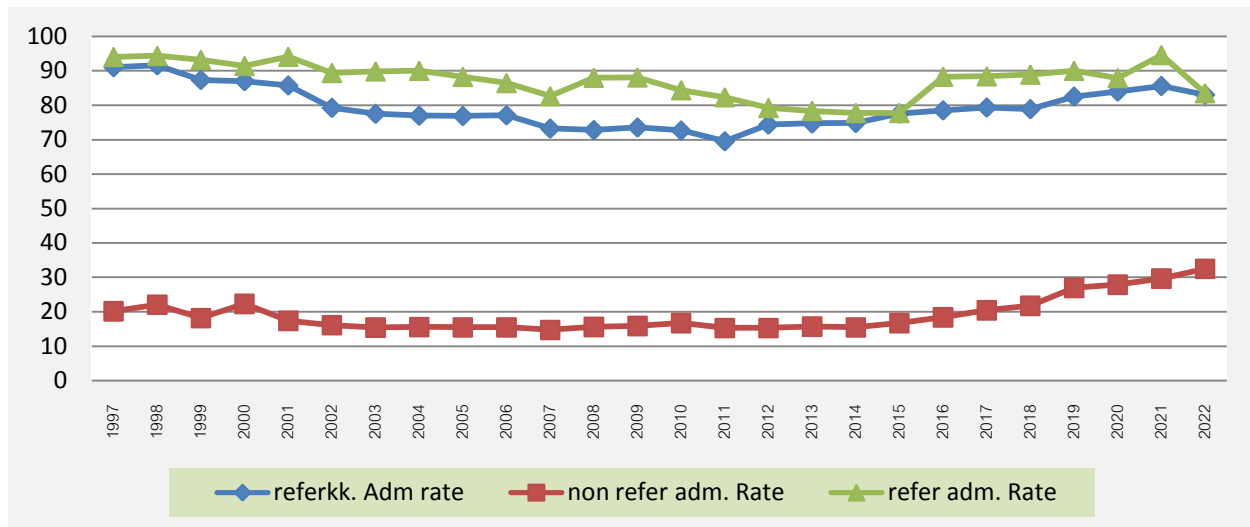

The number of injuries referral was decreasing since 2019. The injuries referral admission rate was slightly decreasing. Focusing on the admission of the referral, it was found that the proportion of the referral admission when comparing with the total admission were very high. This meant that most of the traumatic referred were admissions 70-90 percentage.

**Table 49 Admission rate by referral system (1997-2022)**

Year	in KhonKaen						other province

Khon Kaen Regional Hospital is one of the Trauma Excellent Center, and referral center for the injured patients in the upper North East of Thailand. Therefore most injured patients were come by referral system from hospitals in the province and hospital in other provinces.

**Figure 69 Admission rate by refer and non refer**

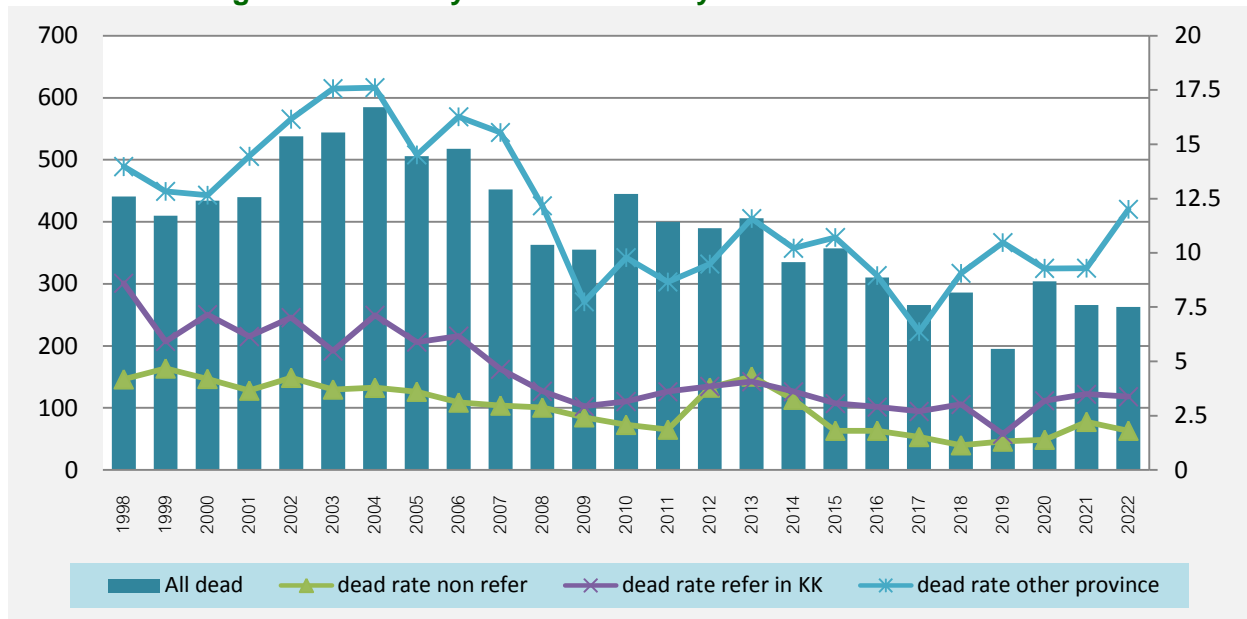

Focusing on the admission of the referral, it was found that the referral other province admission rate had the highest around 80-94 %. The referral in khon kaen province admission rate was the second around 70-91 %.And the non referral admission rate was the lowest.

**4.2 Mortality of referral and non referral (1997-2022)**

**Table 50 Mortality of injury by referral and non referral (1997-2022)**

year	all adm.	All dead	KhonKaen province						other province

**Figure 70 Mortality rate classified by referral and non referral**

The admission death rate of the referral from other province was highest, from hospital in Khon Kaen province was the second, and the non referral was lowest. The death rate of the referral from other province was slightly increasing while the death rate from other two groups was slightly declining.

**4.3 Fatality rate and survival rate by traffic and non traffic cause**

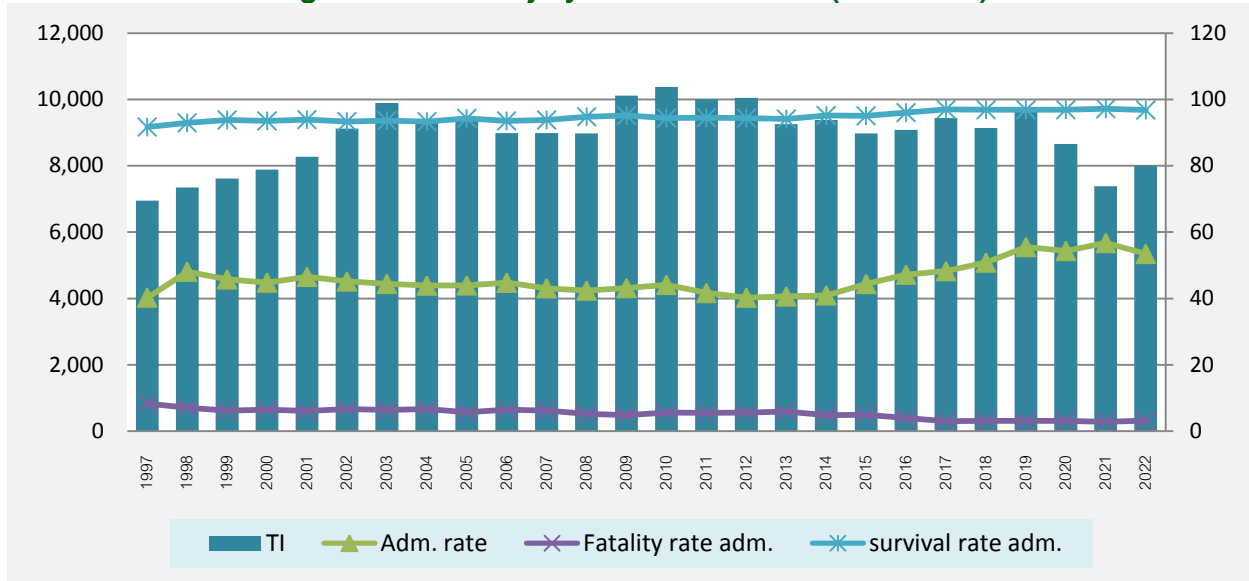

**4.3.1 Traffic injury**

**Table 51 Traffic injury and survival rate (1997-2022)**

It was found that the number of admission was trended to be increased. The number of death had no significantly changed.

**Figure 71 Traffic injury and survival rate (1997-2022)**

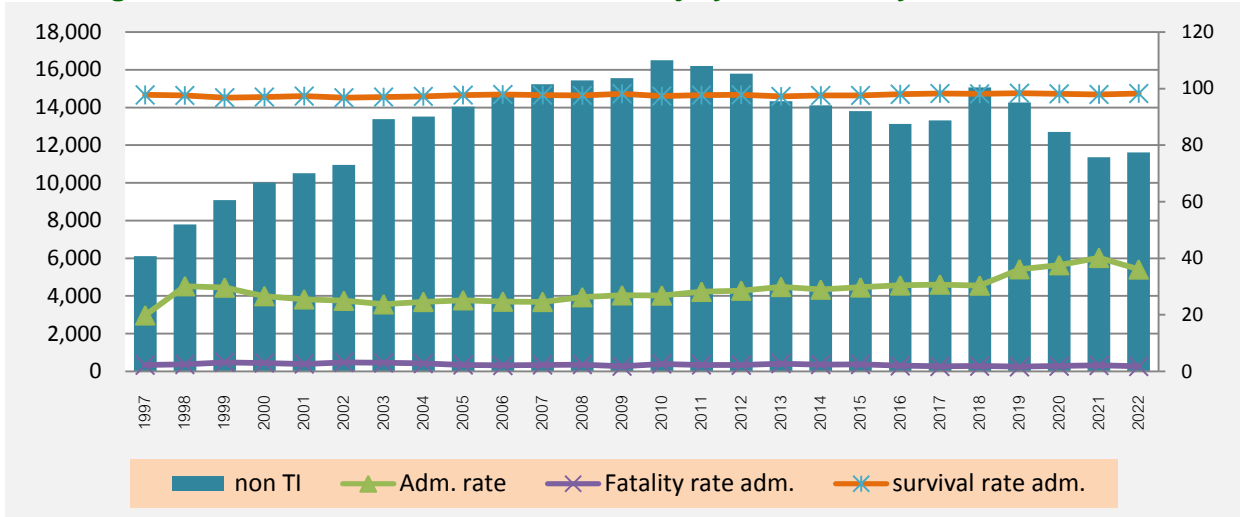

In traffic injury, it was found that the admission rate was 40-56 %. The survival rate was 95-98 %. The fatality rate was 1.9-4.7 % and seemed to have no significantly changed.

**4.3.2 Non traffic injury**

**Table 52 Number of non traffic injury classified by admit, dead, alive (1997-2022)**

**Figure 72 Number and rate of non traffic injury classified by admit, dead, alive**

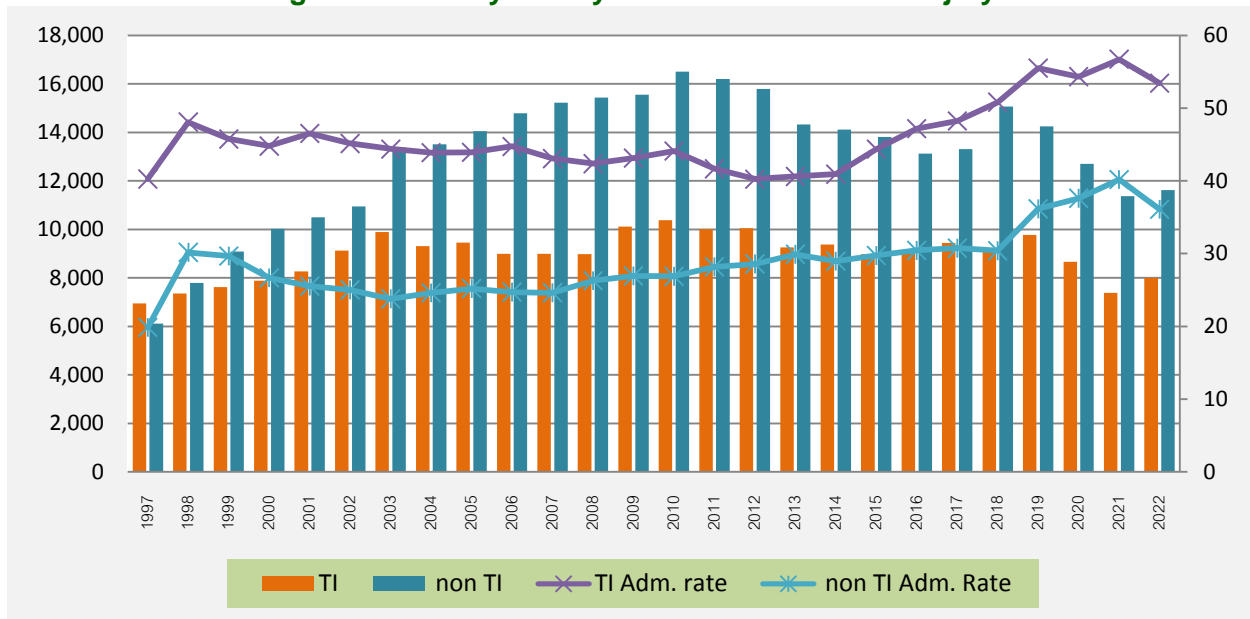

The number of non traffic injury was classified into group of admission, death, and alive. It was found that the number of admission was trended to be increasing. The number of death had no significantly changed.

**Figure 73 Admission rate by traffic and non traffic injury**

The traffic injury admission rate was higher than the non traffic injury admission rate near to 2 times.

**Figure 74 Fatality rate by traffic and non traffic injury**

The number of traffic deaths was higher than non traffic deaths for 2 times more. The traffic fatality rate and non traffic fatality rate trended was decreasing.

**Quality of care**

Emergency Medical Service (EMS) is one of the important components of trauma care which needs to be monitored for the quality of its service. The EMS station can be categorized into two levels as following; 1) Advance station consisted of doctor, nurse and Emergency Medical Technician (EMT) who were trained for 2 years 2) Basic station, consisted of first responders or volunteers who were trained for 110 hours. Therefore, the trend of undo critical procedures could be used to detect how efficient the mission of pre-hospital care was. As shown in next Table, the 4 critical procedures including respiratory care; stop bleeding, splint/ slap and intravenous fluid were monitored.

**Figure 75 Comparison undo critical procedure by EMT**

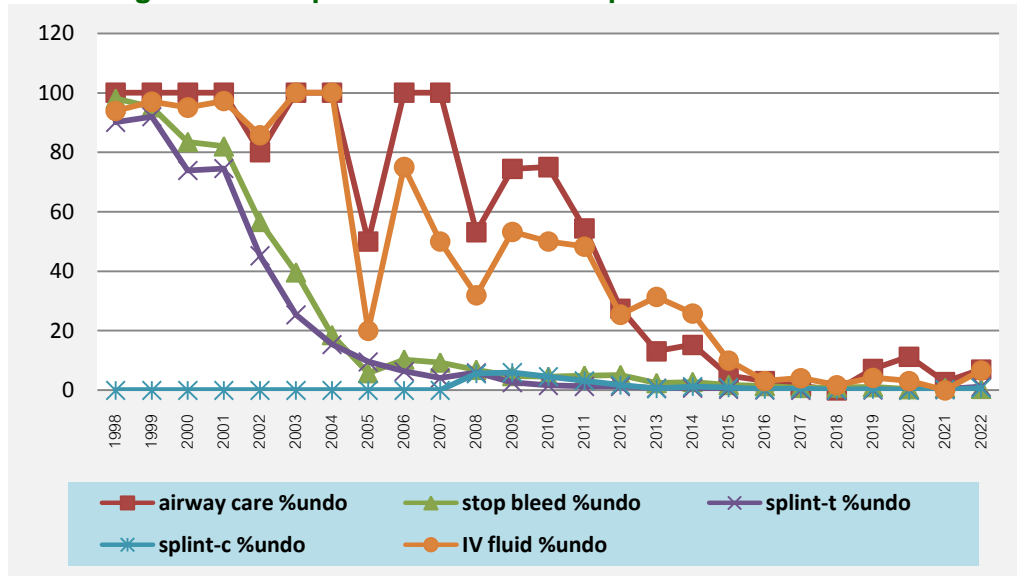

The trend of undo critical procedures was decreasing especially in case of EMT care whose experienced advance life support team and full option of advance equipments.

**Table 54 Critical procedure performed by Volunteers (1997-2022)**

In the referral system, the 5 critical procedures were also applied to monitor the quality of care.

**Figure 77 Percentage of undo critical procedure by referral system**

It was found that, the undo critical procedure was continuously decreasing. While the trend of all pitfalls was reducing; the respiratory care was shown to have least defect.

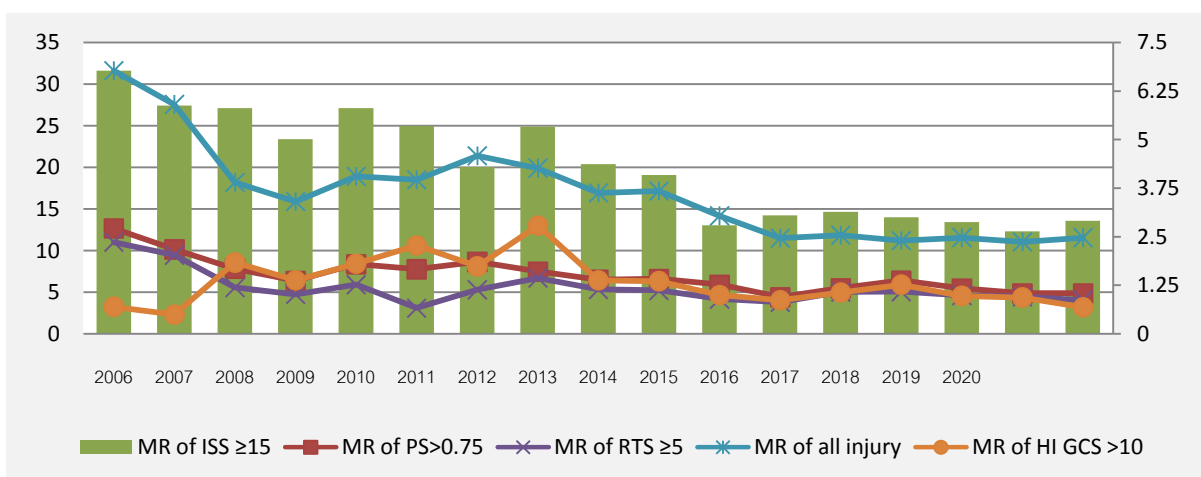

**Severity of injury**

**Trauma project monitor for quality improvement in Trauma care**

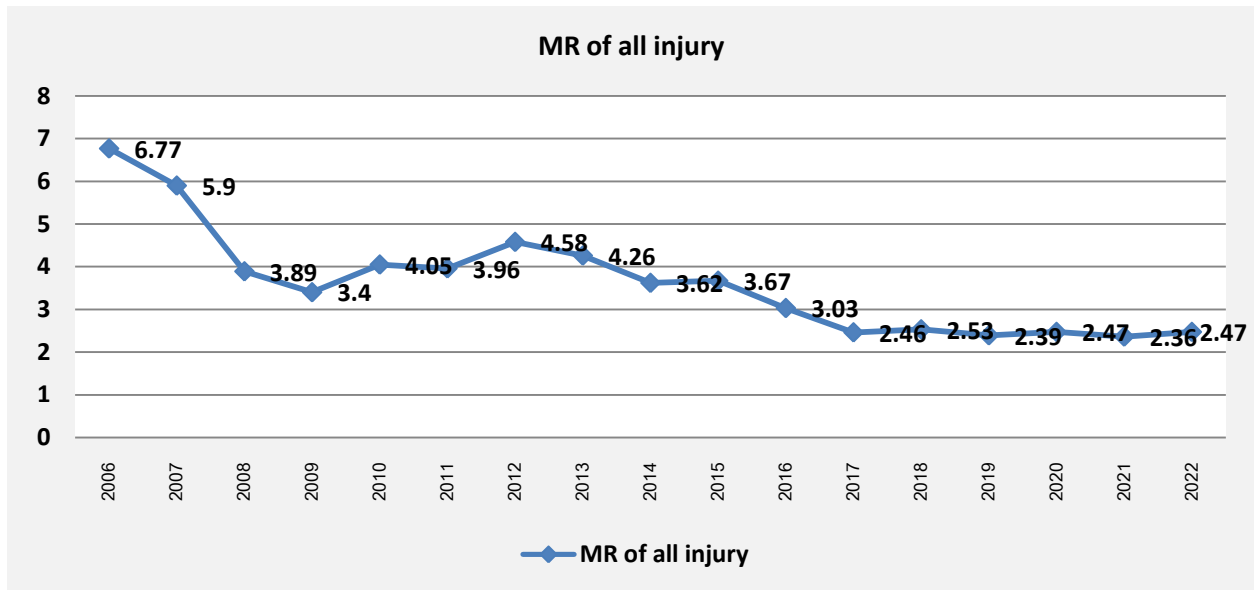

**Table 56 KPI for quality improvement in trauma care (Admission) 2006 - 2022**

**Figure 78 KPI for quality improvement in admission trauma care 2006 – 2022**

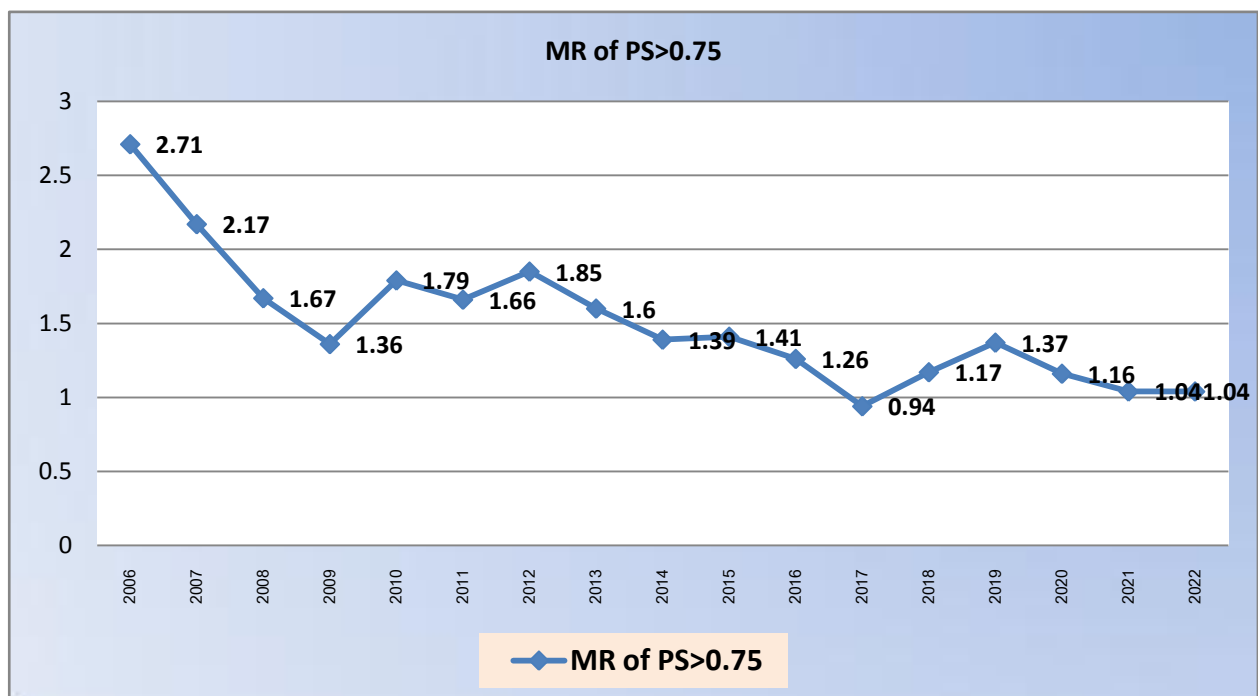

**Figure 79 MR of All injury Admission 2006 – 2022**

The Mortality rate of all injury was decreasing year by year.

**Figure 80 MR of PS>0.75 Admission 2006 – 2022**

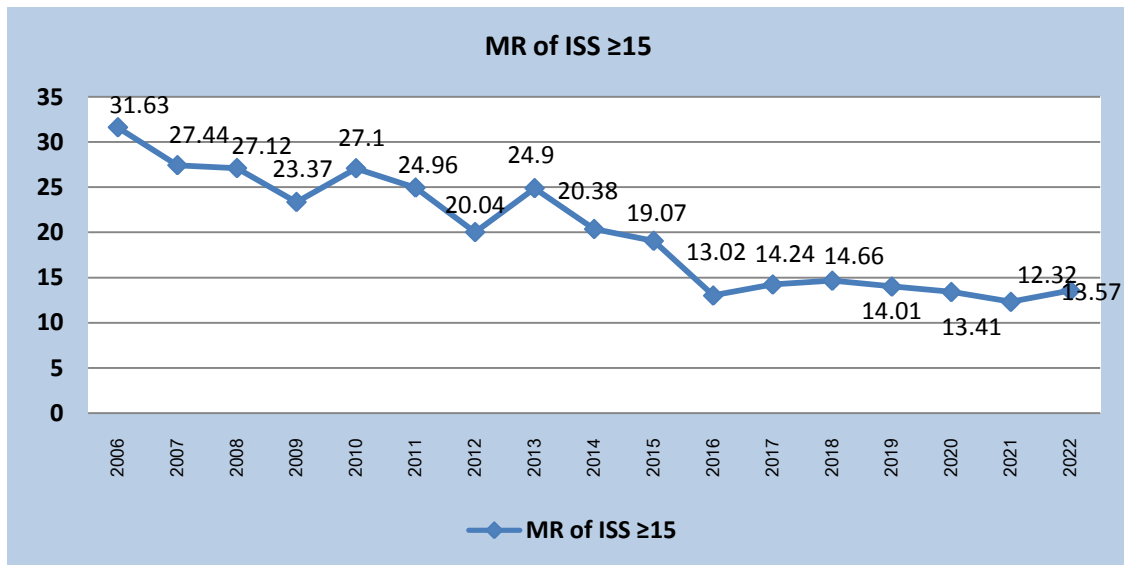

Knowing the probability of survival score (Ps score) enables the health service provider to group the patient according to the severity of injury and to evaluate the result of treatment as follows:

Patient who has Ps>0.75 has opportunity of survival more than 75%. If the patient in this group dies, the death of this case is preventable death resulting from the pitfall of treatment. (Witaya Chadbunchachai, 1998)

Therefore the Ps >0.75 was applied to assess how quality of care in hospital is. And from the figure; it was shown the preventable death was reducing significantly every year.

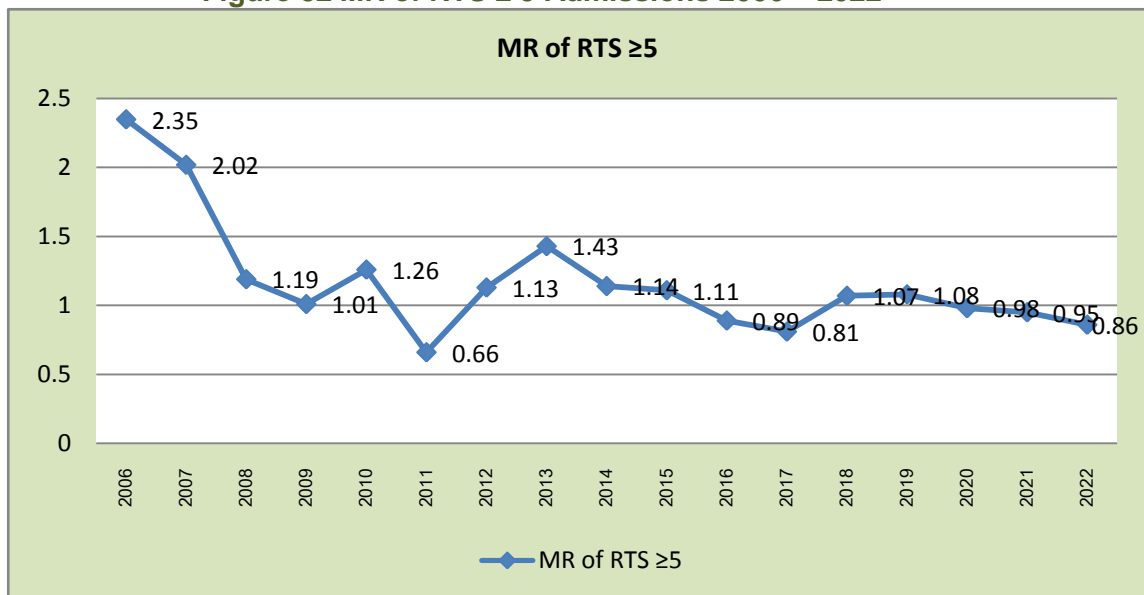

**Figure 81 MR of ISS ≥ 15 Admissions 2006 – 2022**

The Injury Severity Score (ISS) is an anatomical scoring system that provides an overall score for patients with multiple injuries. Each injury is assigned an [Abbreviated Injury Scale](#) (AIS) score, allocated to one of six body regions (Head, Face, Chest, Abdomen, Extremities (including Pelvis), External). Only the highest AIS score in each body region is used. The 3 most severely injured body regions have their score squared and added together to produce the ISS score. The anatomic measures of injury severity score is a method for describing patients with multiple injuries and evaluating emergency care.

(<http://emedicine.medscape.com/article/434076-overview>) From the figure, it was indicated the decreasing the mortality rate of the patient who had got injury with a major trauma (ISS > 15) in KhonKaen Regional Hospital since 2006.

**Figure 82 MR of RTS ≥ 5 Admissions 2006 – 2022**

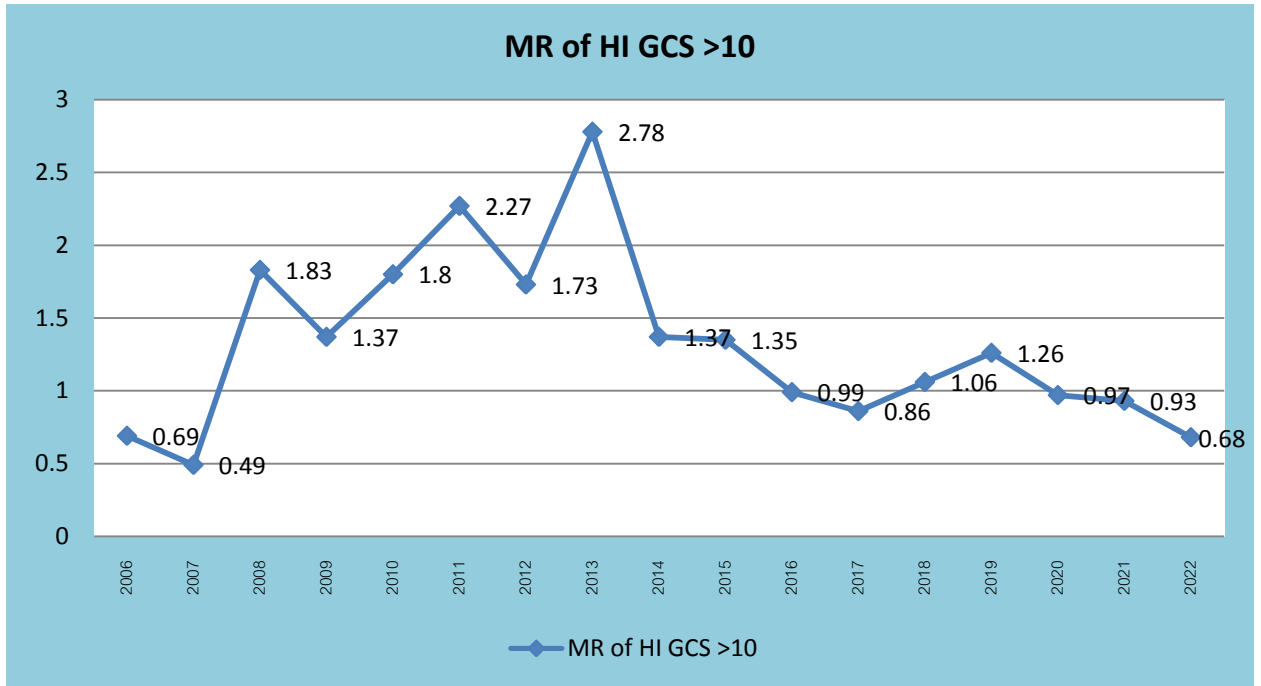

The Revised Trauma Score (RTS) is one of the more common physiologic scores. It uses 3 specific physiologic parameters, as follows: (1) Glasgow Coma Scale (GCS), (2) systolic blood pressure (SBP), and (3) respiratory rate (RR). An RTS of less than 11 is used to indicate the need for transport to a designated trauma center. The coded form of the RTS is used more frequently for quality assurance and outcome prediction. The coded RTS is calculated as follows, in which SBP<sub>c</sub>, RR<sub>c</sub>, and GCS<sub>c</sub> represent the coded values of each variable:

$$RTSc = 0.9368 GCS_c + 0.7326 SBP_c + 0.2908 RR_c$$

(<http://emedicine.medscape.com/article/434076-print>)

From this figure, the decreasing the mortality rate of the patient with a RTS score more than 5 in KhonKaen Regional Hospital since 2006.

Figure 83 MR of HI which GCS > 10 Admissions 2006-2022

It was point out the group of patient who needed to close monitor due to high mortality rate was the group of injury with Head and Glass glow Coma Score more than 10.

#### 4.6 GIS based for monitoring the injury prevention program in Khon Kaen Municipality

KhonKaen is the commerce and political center of Northeastern Thailand, located in the heart of northeast region of Thailand (Isaan). In the last several years, construction has restarted within the city, including the widening of Mitaprah Road on the West side of Khon Kaen (Highway 2 Bangkok-NongKhai). The present population of the city is around 1,806,080 (Khon Kaen municipality,2018).

Khon Kaen municipality, the urban boundary area in Muang District, Khon Kaen province. Since these places tend to be overly commercialized and also it was the center of education in the region, therefore the transportation was affected by these growing. KhonKaen Regional Hospital is the tertiary care for Trauma and Critical Care who take a responsible for all victims in Khon Kaen province and also the network hospital. By using the Geographic Information System(GIS) which was developed since 1998 to do data collection of the traffic injuries location in Khon Kaen Municipality and monitor and evaluation the injury prevention program in Khon Kaen municipality.

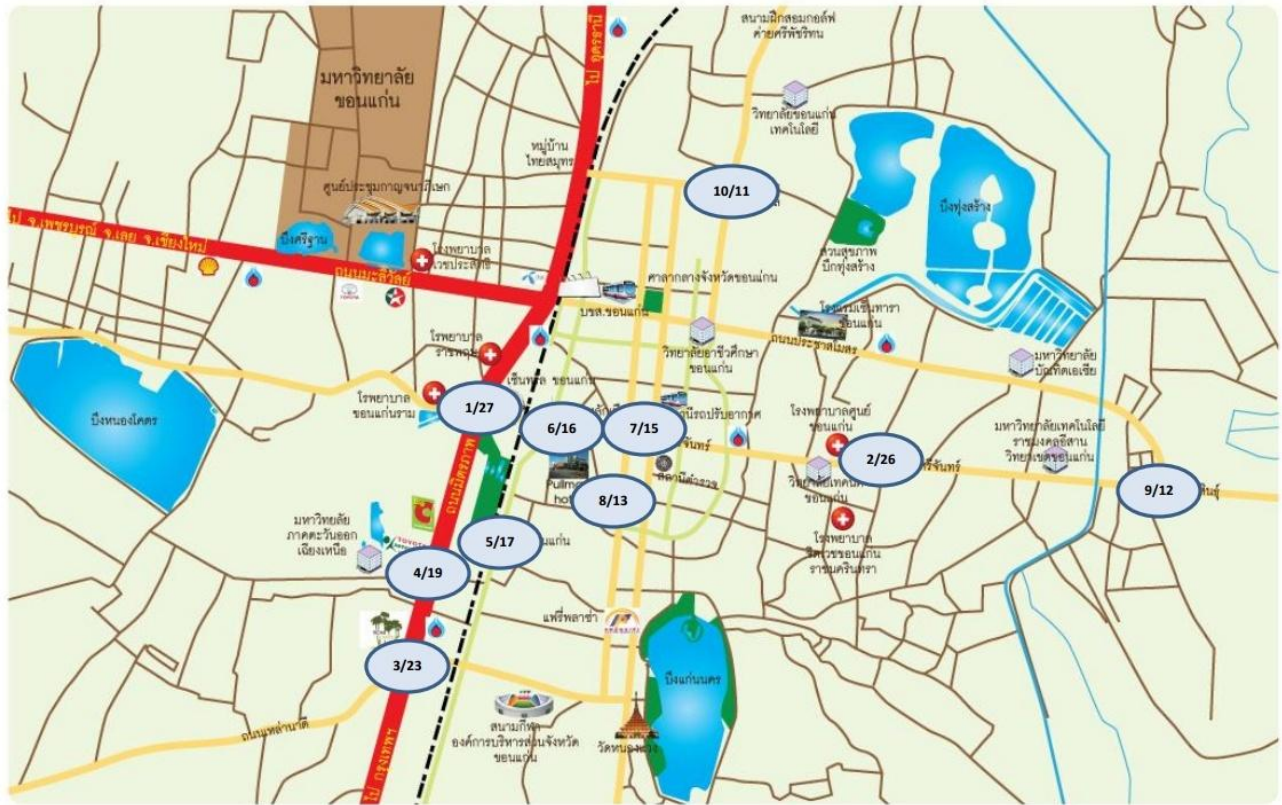

The data analysis by using the GIS data based was shown as following;

**Table 57 Ranking of intersection Accidents in Khon Kaen municipality 2022**

No.	Intersection Name	Number of injury	Number of dead
